CASE STUDY

Lead Engine

An automated B2B outreach system for the Riyadh market, built by Osama Siddiqui at Connect World Business.

What it does

Pick a tower or district in Riyadh. Lead Engine finds the companies there, reads their websites for a real contact address, and sends the outreach on a daily schedule from two Gmail mailboxes. It follows up once, then records replies, opt-outs and bounced addresses, all in one Google Sheet.

What the business gains

- **Hours back every week.** Finding companies, copying websites, hunting for emails and tracking who was contacted is no longer done by hand.
- **Consistent daily outreach.** Sending runs every day of the week, including Friday, spread across the working hours instead of in one burst.
- **One clear view.** Every company, email, industry, status and follow-up date sits in a single sheet, so the next action is always visible.
- **Healthy sender reputation.** Only real addresses on the company's own domain are used, and the system never emails the same contact twice.

Built-in safeguards

- **No guessed emails.** If a website shows no real address, the company is skipped.
- **STOP is final.** Every email carries an opt-out line. A reply asking to stop locks that contact permanently, in line with the spirit of Saudi PDPL.
- **Limits that protect Gmail.** Each mailbox has its own daily limit and its own pause between emails.
- **Private keys.** The Google Places API key is stored in protected script settings, not in the sheet.

Configured capacity

60	companies found per search
2	Gmail mailboxes sending in parallel
7	sending days a week, Friday included
14	days before the single follow-up
0	guessed email addresses

These are configured limits and design rules, not campaign results.

Where it fits

Agency lead generation, recruitment and job outreach, B2B sales prospecting, and partnership outreach, for any business that wants steady, personal, compliant outreach without a manual research team.
